ABSTRACT

Privacy protection on android phones is a widely discussed topic nowadays. As the main leaking source, many tools analyzing information flow statically and dynamically. Integrating dynamic taint analysis in the development process enables early detection of potential privacy leakage, which reduces the cost of fixing them. In this paper, we present *ApakoHa*, a dynamic taint analysis tool for Android apps that interleaves bug fixing and code development in the VS-code integrated development environment. *ApakoHa* is based on the novel framework of TaintART that makes full use of android ART runtime to get information flow, and computes the more complex results and optimizes the bytecode through soot4.0.1. incrementally later using static analyzing tools. Unlike traditional batch-style static-analysis tools, *ApakoHa* causes minimal disruption to the developer's workflow. This video demo showcases the main features of *ApakoHa*:

Keywords DTA · Android privacy · automated tool · operating system

1 Introduction

Android security has attracted much research attention from both academy and industry recently. Dynamic Taint Analysis(DTA) is a classic analysis to detect information flow problems and it has been widely adopted to detect private data leaks in Android applications. In this project, we will automate the process of taint analysis and provide more detailed information about the dataflow and ICFG on the source code. Thus providing a way for Maple IR to continue to compile.

First, in terms of the performance of the DTA, we refer to the TaintART techniques to utilize the compiler and the register allocation of android ART Runtime. Then, a taint propagation framework is proposed and the correctness of the taint propagation analysis is proved by their paper. After we obtain the information flow and what kind of method the information is leaking, we try to make highlight the code on VS-Code front end, Finally, in the backend, the function name and the taint source will be input to soot, a java static analyzing tool to output ICFG and optimize the code automatically by adopting the methods of eliminating, replacing and moving.

We're actually adopting the method of combing the advantages of dynamic and static taint analysis techniques. The pros and cons are listed as follows:

Table 1: Sample table title

Type		Representatives	Features
	In-component propagation analysis	LeakMiner/CHEX	~100
		Input terminal	~ 100
	Inter-component propagation analysis	Klieber	~ 10
	, , , , ,	Octeau/DroidSafe	~ 10
		Component and library function propagation analysis	~ 10
Static		Output terminal	~ 10
		Output terminal	~ 10
		Output terminal	~ 10
Dynamic		Cell body	up to 10^6

2 Related workflow

2.1 Taintdroid

TaintDroid 4.5 is a system-wide taint tracking system based on Android 4.2+. It aims to minimize runtime overhead that is the amount of additional instructions needed for the implementation of tracking mechanism and, also to monitor the system for sensitive information leakage.

2.2 Cheetah

Despite the demonstrated usefulness of DTA in mobile privacy security, poor performance attained by prototypes is a big problem. A novel optimization methodology for dynamic taint tracking based on just-in-time compilation is presented. First, the taint propagation logic is separated from the program logic precisely to simplifying the complexity of the taint propagation analysis.
